

SQA Project – Week 3

Final Project Report

1. Project Overview

This project focuses on automation testing and API testing basics. The goal is to automate test cases using Selenium and understand QA reporting.

2. Testing Methodology

Automation testing is performed using Selenium WebDriver with Python. Black-box testing approach is used to validate application functionality without accessing internal code.

3. Test Case Summary

Automated Test Cases:

- Login Validation Test
- Dashboard Functionality Test

4. Bug Report Summary

No critical bugs found during automation execution. Minor UI inconsistencies may occur depending on browser rendering.

5. Automation Scripts (Selenium)

```
from selenium import webdriver
from selenium.webdriver.common.by import By
import time
```

```
driver = webdriver.Chrome()
```

```
# Login Test
```

```
driver.get("https://example.com/login")
```

```
driver.find_element(By.ID, "email").send_keys("test@example.com")
```

```
driver.find_element(By.ID, "password").send_keys("123456")
```

```
driver.find_element(By.ID, "login").click()
```

```
time.sleep(3)
```

```
# Dashboard Test
```

```
driver.get("https://example.com/dashboard")  
time.sleep(3)
```

```
driver.quit()
```

6. Key Learnings

- Basics of Selenium automation
- Understanding test automation flow
- Importance of QA documentation
- Execution of simple UI test cases
